

Application in Real Life Scenario Case Study

Description:

The scenario focuses on the use of data analytics in the transportation to optimize route planning and reduce travel time for passengers to travel across different places.

Planning:

It is the basic step of gathering the requirements in data analytics. It defines the goal of the objective to reduce the time taken by the passenger in the transportation industry

Planning

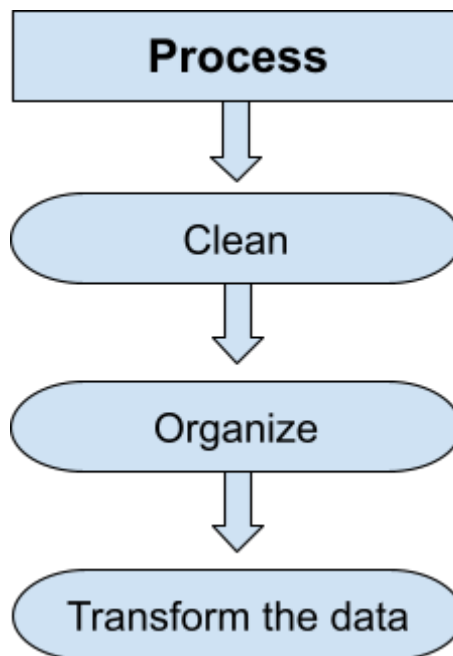

Prepare:

In this step, we gather relevant data from various sources, such as GPS tracking, traffic patterns, and public transportation schedules.

Process:

Process transform the data into a usable format. Which includes the execution and implementation of the routes and accessible roads that reduces the travel time

Key Elements:

Analysis:

We have to choose that route which requires less time to reach the destination . It may depends on the Traffic , the time it requires to reach the destination , optimal travel times and based on some other circumstances.

Share:

To identify the best routes which takes the optimal time than the required time to reach the destination

Act:

Implement the suggested improvements, like adjusting routes and schedules based on insights.

You finally choose that route after the analysis which required less time to reach the different places.
